

SMAART Institute Mobile App Current Status Table

Prepared: 2026-09-06

Source reviewed: mobile-app/ source files, navigation, API clients, README, and implementation map.

Overall Status

Module	Current status	Evidence in app	Open gaps / risks
App shell and navigation	Mostly done	App.js, src/navigation/RootNavigator.js, AppStack.js, MainTabs.js; bottom tabs for Home, Learning, Career, Community, Profile; stack routes for assessment, notifications, support, settings, career, learning, community detail screens	Needs full route QA on real device; Assessments is stack route/shortcut rather than bottom tab
Theme and base UI	Mostly done	ThemeContext.js, ScreenContainer, AppButton, PillButton, Banner, SkeletonBox, SideDrawer	Some design consistency still depends on screen-by-screen QA; shared Card/ListItem/EmptyState abstractions are not formalized
Authentication	Done in code, needs device QA	Auth screens for splash, onboarding welcome, institution selector, login, OTP, signup, signup OTP, create password, forgot/reset, forced password change; AuthContext.js; api/auth.js; expo-secure-store; biometric unlock	OTP delivery, first-login password change, token renewal expiry behavior, and biometric behavior need physical-device/live-account verification
Profile completion onboarding	Done in code, needs live QA	src/screens/onboarding/ProfileCompletionScreen.js, api/profile.js; gated by needsProfileCompletion in auth context	Backend data overwrite/security behavior should be rechecked before launch
Home dashboard	Mostly done	HomeScreen.js; uses course enrollments, stage status, college banners, unread notification count, drawer shortcuts	Needs live-data QA across empty, new, active, and completed student states
Side drawer	Done in code	SideDrawer.js overlays app stack; routes to profile, notifications, support, settings, performance, career tools, face verification, logout	Currently custom drawer, not React Navigation drawer; verify gestures/overlay behavior on small devices
Assessments dashboard	Mostly done	AssessmentsScreen.js; T1-T4 cards, stage status, lock handling, attempt count	Needs live testing for all lock/attempt edge cases
Assessment player	Mostly done	AssessmentPlayerScreen.js; backend attempt lifecycle, timer, answer save, retry queue, submit handling; lazy-loaded in AppStack.js	Must be stress-tested for app backgrounding, network drops, expired assessment token, and server held state
Proctoring during assessment	Partial to mostly done	ProctoringGate.js, useProctoringSession.js, api/proctoring.js; pre-attempt face gate, heartbeat, background detection, server decision handling	Continuous face re-verification/gaze/audio/environment checks not built; physical-device validation is mandatory
Face verification test	Partial validation tool	FaceVerificationTestScreen.js, src/facepipeline/*; lazy-loaded to avoid startup native crashes	Pipeline exists but needs Android/iOS physical-device verification and model download validation
Learning catalogue/path	Mostly done	LearningScreen.js; published courses, enrollments, staged/track paths, search, unlock presentation	ENFORCE_PROGRESSION_GATES appears intentionally disabled in courseUnlock.js; product must decide whether to enforce
Course player	Mostly done	LearningScreen.js, CourseVideoPlayer.js, CourseVideoPlayerImpl.js, courseFlow.js; loads course content, stages, progress, notes; saves video/quiz/progress	Needs live content QA for all content shapes; large screen file may need later refactor after stabilization
Learning tools	Mostly done	CertificatesScreen.js, NotesScreen.js, LibraryScreen.js, CgpaCalculatorScreen.js	Verify APIs and empty/error states with real accounts; certificate verification/export behavior may depend on web

Module	Current status	Evidence in app	Open gaps / risks
Career placements	Mostly done	CareerScreen.js, JobDetailScreen.js, api/placements.js; jobs, applications, withdrawal, offers, fairs, companies	Apply payload is minimal; resume/file attachment behavior may need product decision
AI Career Coach	Mostly done	CareerCoachChatScreen.js, api/careerCoach.js / career agent APIs	Needs API key/backend reliability QA and chat error handling review
Career directions	Mostly done	CareerDirectionsScreen.js, api/careerAgent.js	Needs live account QA for lock/onboarding/dashboard branches
Resume Builder	Mostly done	ResumeBuilderScreen.js, api/resumes.js, Toolkit link	PDF export is not a polished native export; verify backend export behavior and UX wording
Career utilities	Mostly done	SkillsVaultScreen.js, ToolkitScreen.js, DictionaryScreen.js	Confirm exact product naming and whether Skills Vault equals Skills Passport requirements
Community notices/discussions	Mostly done	CommunityScreen.js, DiscussionDetailScreen.js, api/announcements.js, api/communityFeed.js	Needs live QA for create/reply permissions, pagination, and moderation states
Study groups/chat	Mostly done	CommunityScreen.js, api/groups.js; group chat polling while open	Polling load and chat consistency should be tested with multiple users
Vision board	Mostly done	VisionBoardScreen.js, VisionBoardCreateScreen.js, VisionBoardDetailScreen.js, api/visionBoard.js	Needs live create/update/delete/media QA depending on backend capabilities
Profile	Mostly done	ProfileScreen.js, profile/certification UI, api/profile.js	Verify edit permissions, certifications, and server field mapping
Settings	Mostly done	SettingsScreen.js; biometric toggle, theme switch, password change, device/session info	Notification preferences are not present unless backend supports them
Notifications list	Mostly done	NotificationsScreen.js, api/notifications.js; list, unread filter, mark read/all, delete/clear	Live badge and list refresh need QA; pagination and empty states should be tested
Push notifications	Partial	expo-notifications dependency, pushNotifications.js, AuthContext.js registers/unregisters tokens, notificationsAPI.registerDevice	Actual delivery requires real device, dev/prod build, EAS project ID, and Firebase/Expo credentials
Support and grievances	Mostly done	SupportScreen.js, api/tickets.js, api/grievances.js; create, history, detail modal, response/reply flow	Attachments/file picker not implemented; verify resolved/closed reply restrictions
Performance analytics	Partial to mostly done	PerformanceScreen.js, api/analytics.js	Needs validation against real analytics data and expected stakeholder metrics
Build/config	Partial	app.json, eas.json, metro.config.js, Android folder, native dependencies installed	Production build and physical-device testing are still the biggest release readiness unknowns

Phase Status

Phase	Scope	Status	Notes
Phase 0	Project setup, Expo config, dependencies, navigation scaffold	Done	App structure and config exist. Native modules mean custom dev client/builds are required.
Phase 1	Core auth and profile completion	Done in code	Needs complete live account and physical-device verification.

Phase	Scope	Status	Notes
Phase 2	Assessment engine	Mostly done	Dashboard/player are built; verify server token, retry queue, submission, held state, and lock edges.
Phase 3	Proctoring adaptation	Partial to mostly done	Face gate, session heartbeat, and background detection exist; continuous monitoring remains deferred.
Phase 4	Learning/course platform	Mostly done	Course catalogue/player/progress/tools exist; lock enforcement decision remains open.
Phase 5	Career and placement	Mostly done	Placements, applications, coach, directions, resume, toolkit, dictionary exist; export/attachment polish remains open.
Phase 6	Community/gamification	Mostly done for community, partial for gamification	Notices, discussions, groups, chat, vision board exist; badges/streaks/wellbeing are not confirmed/built as full features.
Phase 7	Support and notifications	Mostly done, push partial	In-app notifications/support/grievances exist; actual push delivery is not proven.
Phase 8	Hardening and QA	Not complete	Requires device testing, network failure testing, proctoring validation, and build validation.
Phase 9	Store submission	Not started	Requires release build, assets, permissions wording, privacy data, and QA signoff.
Phase 10	Post-launch operations	Not started	Requires monitoring, crash reporting, support workflow, and feedback loop.

Priority Gaps Before Launch

Priority	Gap	Why it matters	Suggested next action
P0	Physical Android/iOS validation	Camera, biometrics, ONNX, push notifications, splash, and native modules cannot be trusted from source review alone	Run full QA on real Android and iOS dev/prod builds
P0	Assessment/proctoring live attempt QA	Assessment data loss or incorrect held state is high risk	Test start, answer save, retry, submit, backgrounding, warn/pause/held with real backend
P0	Push notification delivery	Code registers tokens, but delivery depends on credentials and device builds	Configure EAS/Firebase credentials and send test push
P1	Course unlock enforcement decision	Lock logic exists but enforcement appears disabled	Product/academic team should decide and document intended visibility rules
P1	Resume/certificate/report export	Native export is not fully polished	Decide between web deep-link export and native PDF implementation
P1	Backend/profile security review	Profile registration endpoints may trust request body identity depending on backend behavior	Audit backend auth/authorization before launch
P2	Shared UI cleanup	Large screens contain repeated UI patterns	Refactor after QA, not before, unless bugs force it
P2	Gamification/wellbeing scope	Badges/streaks/MindCare are not clearly complete mobile features	Confirm scope and either implement or explicitly defer

Evidence Files Reviewed

Area	Files
App entry/navigation	mobile-app/App.js, src/navigation/AuthStack.js, src/navigation/AppStack.js, src/navigation/MainTabs.js, src/navigation/RootNavigator.js
